

SQL Study Group

Hands-On Practice #1

Hey buddy,

I see you.

Yes, you.

Showing up for day lessons.

Taking the quizzes.

Dropping screenshots in the group.

Leaving comments.

Staying consistent.

That's not a small effort.

That's discipline. And I'm proud of the effort you've been putting in.

Now... let's test those skills a little.

Not in a scary way, but in a **“let's see what you can really do”** way.

I've put together this hands-on practice file that touches everything you've learned so far: tables, filtering, operators, WHERE, logic, and query thinking.

This is where learning turns into doing.

The Mission

Imagine you've just been given an employees database at work.

Your task?

Write SQL queries to answer real business questions.

I promise not to scare you, I promise a soft landing in levels

Level 1: Basic Filtering

Let's start easy.

Shall we?

A) The High Earners

Find all employees earning **120,000 or more**.

B) **Specific Identification**

Retrieve full details for the employee with **employee_number 1005**.

C) **Department Search**

List everyone working in the **IT department**.

Level 2: Smart Logic *(Now Let' get you thinking)*

Time to combine conditions like an analyst.

A) **The Finance Team**

Find all **female employees** in the **Finance department**.

B) **Budget Planning**

List employees whose salaries fall **between 70,000 and 90,000**.

C) **Availability Check**

Find employees who are **not currently Active**
(example: *On Leave, Resigned*).

Level 3: Pattern Matching *(This puts you in a Detective mode)*

Let's begin with some searches:

A) **Management Search**

Find employees with the word "**Manager**" anywhere in their **job_title**.

B) **Regional Support**

Use the **IN operator** to find employees in:
Sales, Marketing, or Operations.

C) **Name Lookup**

Find employees whose **first_name starts with "A."**

Finally,

It's time to combine everything you've learned.

One query = Multiple conditions = analyst thinking.

Your task:

Find all **Male employees** who:

- Work in **Sales OR IT**
- Were hired **after 2015-01-01**
- Earn **more than 80,000**

This is where SQL stops being theory... and becomes power.

As you Coach, I recommend this:

- Don't rush
- Think before typing
- Break problems into parts
- Test your queries
- Adjust and try again

This is practice, mistakes are expected. That's how real learning happens.

This exercise is a snapshot of what analysts actually do daily with SQL:

- Ask questions
- Query databases
- Filter data
- Combine logic
- Deliver answers

You're not just learning SQL anymore.

You're using it. Exciting, right?

Your Turn

Open your SQL editor.

Start with **Level 1**.

Work your way up.

And when you conquer the **Final Boss**, drop your result in the group

Let's have fun with this.

Let's break things.

Let's learn by doing.

This is where confidence is built.

So, break a leg!
